TASK 1: CLASSES & OBJECTS

Python OOP Practical Report — 20 Marks

1. Objective

To create a Python class representing a real-world entity, define attributes and a method, create at least two objects, and display the information of each object.

2. OOP Concept Used

Class, objects, attributes, methods, constructor, and object instantiation.

3. Source Code

```
class Student:
    def __init__(self, name, roll_no, branch, marks):
        self.name = name
        self.roll_no = roll_no
        self.branch = branch
        self.marks = marks

    def display(self):
        print("Student Name:", self.name)
        print("Roll Number:", self.roll_no)
        print("Branch:", self.branch)
        print("Marks:", self.marks)
        print("----------------------")

# Creating two objects
s1 = Student("Narendra", 101, "CSE", 85)
s2 = Student("Rahul", 102, "ECE", 90)

# Displaying information
print("Student 1 Details:")
s1.display()

print("Student 2 Details:")
s2.display()
```

4. Output

5. Explanation

- Class: Student is a class representing a real-world student.
- Attributes: name, roll_no, branch, and marks store student details.
- Constructor: __init__() initializes the attributes when an object is created.
- Objects: s1 and s2 are two objects with different student information.
- Method: display() prints the information of each student.

6. Learning Outcome

I learned how to define a class, create multiple objects, initialize attributes, and use a method to display object information.

7. Conclusion

This program demonstrates the basic concepts of classes and objects in Python by storing and displaying the details of two students.
